INTRODUCTION & Session Overview

Welcome, context setting, and what to expect from the session

What is Zero Trust?

Understanding the “never trust, always verify” model and why it matters

KEY PRINCIPLES OF ZERO TRUST

Five core pillars: Verify Explicitly, Least Privilege, Assume Breach, Protect Data, Visibility.

ROADMAP TO ZERO TRUST IDENTITY

Practical implementation using Entra ID, Intune, and Purview for Zero Trust maturity.

CLOSING & CALL TO ACTION

Recap, key takeaways, and the next steps to begin your Zero Trust journey.

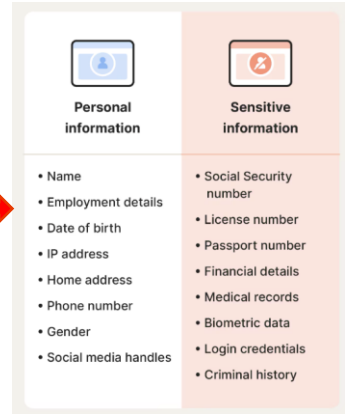

INTRODUCTION & Session Overview

What is Zero Trust?

Simple Definition

Zero Trust is the idea of never trust, always verify

Why it matters?

People Work from everywhere(Airports, Café, Home - Not just the office)

Example: Airport Security

The Five Key Priciples

1 Verify Explicitly

Always validate user, device, location, risk.

Use Entra ID Conditional Access & MFA.

Example: Logins from an unmanaged iPhone trigger extra checks.

2 Least Privilege Access

Limit access by role, time, and context.

Tools: Entra Privileged Identity Management (PIM), Intune app protection policies.

Example: An admin gets elevated rights only when needed, with approval.

3 Assume Breach

Design as if attackers are already inside.

Segmentation, monitoring, logging.

Example: Intune compliance policies block non-compliant devices from accessing corporate apps.

4 Protect Data Everywhere

Use Microsoft Purview to apply sensitivity labels and encryption.

Data follows the label: whether emailed, downloaded, or shared externally.

5 Visibility & Analytics

Collect telemetry across Entra, Intune, Defender, and Purview.

Use alerts and analytics for continuous assessment.

Example: Impossible travel alerts detect compromised accounts.

UNOFFICIAL

Roadmap to Zero Trust Identity

1 Strengthen Identity & Access

- Deploy Entra ID MFA for all users. Implement Conditional Access policies: block legacy auth, enforce compliant devices.
- Start using Identity Protection for risk-based sign-ins.

2 Secure Devices & Endpoints

- Enroll devices into Intune for compliance enforcement.
- Apply device compliance policies (encryption, OS updates, AV).
- Block access from unmanaged or non-compliant devices.

3 Protect Data with Sensitivity Labels

Roll out Microsoft Purview Sensitivity Labels: Public, Internal, Confidential, Highly Confidential.
Configure auto-labelling for high-risk content (credit cards, health data).Train users on labelling culture.

4 Enable Least Privilege& Just-in-Time Access

- Roll out Entra PIM for admin accounts.
- Apply Just-In-Time access and Just-Enough-Access to high-risk roles.
- Review and clean up unused accounts and stale privileges.

5 Continuous Monitoring & Improvement (Ongoing)

- Enable Microsoft Defender for Identity and Cloud Apps to detect anomalies.
- Review Conditional Access logs monthly.
- Run compliance assessments against ASD Blueprint / Essential Eight.
- Use Purview reports to track data sharing trends.

UNOFFICIAL

Recap

"**Zero Trust** isn't a product — it's a mindset and a journey.

"**Zero Trust** is about not assuming anyone or anything is safe by default. Instead, we verify every person, device, and action.

The five principles are **verify explicitly**; **least privilege**; **assume breach**; **protect data** and **always monitor**."

"**Ask yourself**: What's the one step your organisation can take this month?

"Trust is good, but in today's world, proof is better. That's what Zero Trust is all about."

Thank You
